The data that I will need is:
- Population
    - This will be used to predict traffic to the restaurant.
- Average net income
    - This will help decide how much to charge based on the regulars that would come to the restaurant.
- Annual income from tourism
    - This will decide or help find out how to classify some of the data.
- Number of restaurants
    - This will help pick a location for the new restaurant.
- Type of restaurant
    - This will check the market saturation for types of restaurants.
- Latitude and longitude of the cities
    - This will help map the spots and graph them

All of this data will go back a certain time to account for today's global pandemic and to gather more data to have a better model view for training and other data models.
